

**BEFORE
THE PUBLIC SERVICE COMMISSION
OF SOUTH CAROLINA**

**DOCKET NO. 2019-185-E
DOCKET NO. 2019-186-E**

In the Matter of:)	
)	
South Carolina Energy Freedom Act)	<u>AMENDED</u> SURREBUTTAL
(H.3659) Proceeding to Establish Each)	TESTIMONY OF ED BURGESS ON
Electrical Utility's Standard Offer,)	BEHALF OF SOUTH CAROLINA
Avoided Cost Methodologies, Form)	SOLAR BUSINESS ALLIANCE*
Contract Power Purchase Agreements,)	
Commitment to Sell Forms, and Any)	
Other Terms or Conditions Necessary)	

[*Confidential Information has been redacted. A non-redacted copy is being filed under seal.](#)

1 **Q. Please state your name, occupation, and business address.**

2 **A.** My name is Ed Burgess. I am a Senior Director at Strategen Consulting. My business
3 address is 2150 Allston Way, Suite 400, Berkeley, California 94704.

4 **Q. Are you the same Ed Burgess that offered direct testimony in this docket?**

5 **A.** Yes.

6 **Q. What is the purpose of your surrebuttal testimony?**

7 **A.** The purpose of my surrebuttal testimony is to respond to certain issues raised by Duke
8 Energy Carolinas LLC and Duke Energy Progress LLC (collectively, “Duke”) in the
9 rebuttal testimony of Mr. Glen Snider, regarding the companies’ avoided cost
10 calculations.

11
12 **I. Incentives & General Issues**

13 **Q. What does Duke’s rebuttal testimony claim regarding the utility incentive to limit**
14 **QF deployment through low avoided cost rates?**

15 **A.** Duke argues that it has no incentive to limit QF deployment through low avoided cost
16 rates for two main reasons. First, Duke argues that solar QFs have “little impact on the
17 need for future generation,”¹ and therefore do not displace utility-owned generation.
18 Second, Duke argues that fuel costs displaced by QF power are “a pass-through expense
19 paid directly by Duke’s customers” and therefore “Duke is financially indifferent to
20 purchasing any of these fuel sources.”²

¹ Snider Rebuttal, p 6.

² Snider Rebuttal, p 6.

1 **Q. Do you agree with either of these points?**

2 A. No, I do not.

3 **Q. Regarding the first point – that QFs have “little impact” on the need for utility-**
4 **owned generation -- does Duke claim that solar QFs have *zero impact* on its needs**
5 **for future generation?**

6 A. No. While Duke claims that solar QFs have “little impact”, the Company notably does not
7 claim that these resources have zero impact on its needs for future generation capacity.
8 Thus, Duke admits that solar QFs do have *some* impact on future generation needs; it is
9 simply a matter of how much. It is worth noting that this purportedly small impact is
10 largely determined by Duke’s own assessment of solar capacity value (which SBA
11 disputes) as well as Duke’s own evaluation of future capacity needs according to its 2019
12 IRP Update (which has not been approved by this Commission). Furthermore, Duke
13 seems to ignore solar QFs that include energy storage, which can provide enhanced
14 capacity value, even during non-daylight hours, and could have substantially more impact
15 than standalone solar on future generation needs. Even if Duke’s conclusion were true
16 (i.e. that solar QFs have “little impact” on generation needs), this conclusion would not
17 also be true for QFs with storage, which can tailor their output towards the hours with
18 highest loss of load risk (e.g. winter mornings). Finally, Duke’s argument leaves out
19 utility-owned generation that might be justified primarily on the basis of lowering overall
20 energy costs, rather than incremental capacity needs. To the extent QFs reduce Duke’s
21 future energy needs, then they could have an impact on utility-owned generation
22 resources.

1 **Q. Regarding the second point – that Duke is financially indifferent to fuel or QF**
2 **purchases that are directly passed through – what is your response?**

3 A. I disagree. As discussed in my direct testimony, Duke’s holding company has a robust
4 natural gas transmission business and is actively developing new pipeline projects. Thus,
5 even if natural gas fuel costs are a pass-through for Duke’s retail electric customers, the
6 overall demand for natural gas in the region could impact Duke’s financial interests. Duke
7 does not dispute this claim in its rebuttal.

8 **Q. Do you agree with Duke’s suggestion that you put forward the concept of the zone**
9 **of reasonableness “in an effort to promote the Commission adopting higher avoided**
10 **cost rates”³?**

11 A. No. This concept was raised in an attempt to describe the de facto reality that there are a
12 range of plausible avoided costs, and a variety of subjective decisions that affect the
13 outcome within this range.

14 **Q. Do you agree with Duke’s assertion (page 11 of Snider Rebuttal) that this concept is**
15 **“wholly inapplicable” within a ratemaking context like this proceeding?**

16 A. No. The “zone of reasonableness” standard is not novel. It was derived from the “just and
17 reasonable” standard and has been outlined in case precedent for decades. Jeff Makholm
18 and Kurt Strunk of the National Economic Research Associates Inc. (NERA) discuss the
19 standard and its usage in court decisions extensively in an article in the Public Utilities
20 Fortnightly journal.⁴ The authors specifically cite a number of decisions that have held the

³ Snider Rebuttal at p 11.

1 Federal Energy Regulatory Commission (FERC) to the “zone of reasonableness”
 2 standard, including one by the Public Service Commission of Kentucky.⁵ An article by
 3 energy attorney Adrienne Thompson of Troutman Sanders LLP in the George
 4 Washington Journal of Energy & Environmental Law⁶ further outlines case law precedent
 5 where the Supreme Court has noted the “zone of reasonableness” standard in utility
 6 regulation⁷ subject to an “arbitrary and capricious” standard under the Administrative
 7 Procedure Act (APA).⁸ The “zone of reasonableness” has also been incorporated into a
 8 new framework for FERC in deciding whether the base return on equity for transmission
 9 investments is just and reasonable. On October 16, 2018, FERC issued an order
 10 addressing four complaint proceedings involving the New England Transmission Owners'
 11 base rate of return on equity (ROE).^{9[6]} The order describes FERC's “proposed
 12 framework” for deciding whether an existing ROE remains just and reasonable in a
 13 complaint proceeding, which includes the establishment of a “zone of reasonableness.”

Cir. 1994); see generally Administrative Procedure Act, 5 U.S.C. § 706(2)(A) (directing courts reviewing agency orders to “hold unlawful and set aside agency action, findings, and conclusions found to be... arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law”).

⁹ Order 165FERC61,030 Directing Briefs re Vermont Transco, LLC Docket Nos. et al under EL11-66 et al. http://elibrary.ferc.gov/0/IDMWS/doc_info.asp?document_id=14712363

1 **Q. Would the adopting the “zone of reasonableness” standard violate either PURPA**
 2 **or Act 62 by creating QF rates that do not reflect the utility’s actual avoided**
 3 **costs?**

4 A. No. Actual avoided costs are unfortunately hard to determine because of a variety of
 5 different inputs that are projected. For example, there is no way to perfectly predict
 6 load growth or commodity prices in 5 or 10 years. As such, models are used to
 7 approximate the avoided costs. Models are only a representation of reality and
 8 naturally insert uncertainty into the outputs. The “zone of reasonableness” standard
 9 recognizes the bounds of uncertainty in the avoided cost rates derived from the
 10 methodology that will be decided upon by the Commission.

11 II. IRP and Model Accuracy

12 **Q. What is Duke’s response to my argument that its modeled avoided cost rates reflect**
 13 **biased methodological choices?**

14 A. Duke argues that its methodological choices are sound because they are consistent with
 15 those already used in its integrated resource plan. This argument falls flat for a few
 16 reasons.

17 First, there is no reason why the IRP itself could not be biased in favor of Duke’s
 18 corporate revenue goals. To this point, it is notable that Duke relied upon a 2019 Update
 19 to its previous IRP. Reliance on this 2019 update is problematic for several reasons:

- 20 • The 2019 Update was provided to parties in this proceeding only very recently
 21 (September 4th, well after Duke’s own testimony was filed and shortly before intervenor
 22 testimony was due) and has not been reviewed or approved by the PSC.

- 1 • The 2019 IRP Update does not reflect the accelerated retirements of five coal plants
2 announced by Duke on September 30th,¹⁰ less than 4 weeks after the Update was filed in
3 this proceeding. Notably, over 1000 MW of these new retirements now occur within the
4 next 10 years¹¹ and would have a substantial impact on the calculation of both avoided
5 energy and avoided capacity costs.
- 6 • The 2019 Update does not reflect additional requirements that the NCUC issued in its
7 recent order in Duke’s North Carolina IRP proceeding.¹²
- 8 • Act 62 includes detailed new requirements for IRP sufficiency that Duke’s 2019 update
9 most likely does not comply with.

10 Second, Duke’s rebuttal insinuates that I have claimed many “novel” methodological choices
11 in this proceeding. That is not the case. In fact, my direct testimony never suggested this, but
12 is simply focused on identifying certain practices that may be biased, regardless of when or
13 where they were adopted. In any event, given the closer evaluation Act 62 requires of the
14 utilities’ avoided cost calculations and methodologies, Duke’s methodological choices should
15 be subject to scrutiny whether or not they represent the company’s historical practice.

16 17 III. Speculative Risks

18 **Q. Does Duke dispute the Commission’s ability to consider of potential risk factors**
19 **such as cost overruns or environmental adders?**

¹⁰ See Duke’s filing in NCUC Docket No. E-7 Sub 1214

¹¹ This includes Allen units 4 and 5 (526 MW total), which are now expected to retire in 2024 instead of the IRP Update assumption of 2028. It also includes Cliffside unit 5, which is not expected to retire in 2026 instead of 2032.

¹² NCUC Docket No. E-100 Sub 157.

1 A. Yes. Duke states that calculation of these factors would be “unprecedented” and
2 “prohibited by PURPA.”¹³

3 **Q. Did you try to quantify these risk factors?**

4 A. No. By Duke’s own admission, “Mr. Burgess makes no attempt to quantify [these risks]
5 as impacting future system costs.”¹⁴ Nor am I suggesting that Duke’s avoided cost
6 calculations should include any kind of “adder” to represent these risks.

7 **Q. Do you think these risks are still something that the Commission should consider,**
8 **even if not directly included in the avoided cost calculation?**

9 A. Yes. The issue of ratepayer risk must be considered under Act 62 and Duke devotes
10 much of its direct and rebuttal testimony to characterizing QF contracts as “risky” for
11 ratepayers. My primary point is that construction of additional utility generation exposes
12 ratepayers to a much wider scope of risks than long-term fixed price contracts. As
13 explained in my Direct testimony, there are a number of places in the avoided cost
14 calculation where methodological choices must be made regarding uncertain inputs and
15 assumptions. This means that there is a range of potential values that could be considered
16 reasonable. Neither end of this range is “correct” but a judgment call must be made by the
17 Commission about where to lean. If there are other risk factors that are not directly
18 reflected in the calculation, they might be worth considering when judging where to lean.
19

¹³ Snider Rebuttal, p 14.

¹⁴ Snider Rebuttal, p 14.

1 IV. Competitiveness

2 **Q. Does Duke's rebuttal argue that there is robust competition for generation supply**
3 **in South Carolina?**

4 A. Yes. Duke invokes the CPRE program as evidence of this competition.

5 **Q. Do you agree?**

6 A. No. At the outset, it is important to recognize that Duke is a vertically integrated utility,
7 which means that it is not only has a monopoly as a seller of electricity to retail
8 customers, it also has a monopsony as a buyer of electricity from wholesale suppliers. As
9 such, Duke has substantial discretion over which suppliers can compete in the market.
10 Both QFs under PURPA and the CPRE program are exceptions to this that increase
11 overall competition for generation supply.

12 **Q. Do you view the CPRE program is evidence of a robust competitive process in**
13 **South Carolina that should be considered as an alternative to PURPA?**

14 A. I believe there are many elements of the CPRE program that reflect a good competitive
15 process and should continue to be pursued. However the CPRE program is also limited in
16 many respects, and thus, should therefore be considered as supplemental to (rather than
17 an alternative to) PURPA in terms of promoting more competition on the supply side.

18 **Q. What are the limitations in the CPRE program for South Carolina?**

19 A. There are several including the following:

- 20 • The CPRE process is primarily controlled by the North Carolina Utilities
21 Commission.

- 1 • Duke did not meet its goals in Tranche 1 of the program (i.e. not enough
2 projects were selected to sign PPAs) and therefore may not be on track to meet its
3 statutory MW targets.
- 4 • Duke is permitted to participate (up to 30% of projects) and therefore the
5 competitive nature of the program is not limited to third party suppliers. In addition, any
6 number of bids may be “asset acquisition” proposals under which Duke purchases the
7 bidder’s facility and incorporates it into the utility’s rate base; and in fact Duke ended up
8 winning almost 45% of the total capacity bids in Tranche 1 of CPRE.

10 V. Ratepayer Impact

11 **Q. What critique does Duke raise regarding your analysis of the potential cost impact**
12 **to Duke’s customers if SBA’s changes are adopted?**

13 A. Duke suggests that my analysis “dodges the question” and does not address the “total
14 impact” of proposed rates.

15 **Q. Is this accurate?**

16 A. No. My analysis was presented as an illustration of the potential impact of one important
17 element of SBA’s proposal – deferring adoption of an integration charge. That being said,
18 I have conducted further analysis of other elements of the SBA recommendations, which
19 are presented below. The analysis confirms that even under a high penetration solar QF
20 scenario, the potential impact to revenue requirement is less than 1% for DEC and less
21 than 2% for DEP.

22 **Q. Would SBA’s proposal constitute a rate increase?**

A. No. The analysis shown below simply indicates the additional payments that QFs would receive under SBA's proposal relative to Duke proposal. As explained elsewhere, I believe SBA's proposal better reflects true avoided costs, as such, these payments would be offset by reduced expenses elsewhere on Duke's system.

	DEC	DEP
MW of Solar (+1500 Scenario)	3020	4610
Percent assumed to be deployed in SC	30%	30%
Capacity Factor (based on a SAT system modeled in SAM)	18.90%	18.90%
MWh output (SC portion)	1,500,010	2,289,750
Integration Charge (\$/MWh)	\$1.10	\$2.39
Total Integration Charge Collected from SC QFs (millions)	\$1.7	\$5.5
Duke Proposed Energy Rate Design (\$/MWh, levelized)	\$29.42	\$26.72
SBA Proposed Energy Rate Design (\$/MWh, levelized)	\$30.49	na
Difference (\$/MWh)	\$1.06	na
Additional Payment to SC QFs (millions)	\$1.59	na
Duke Proposed Capacity Rate (\$/MWh, levelized)	\$0.73	\$1.52
SBA Proposed Capacity Rate (\$/MWh, levelized)	\$4.45	\$3.63
Difference (\$/MWh)	\$3.73	\$2.10
Additional Payment to SC QFs (millions)	\$5.59	\$4.82
Estimated Annual Revenue Requirement (millions)	\$1,720	603
Integration Charge (as % of total RevReq)	0.1%	0.9%
SBA Energy Rate Design (incr. as % of RevReq)	0.1%	na
SBA Capacity Rate (incr. as % of RevReq)	0.3%	0.8%
Total Impact of SBA Changes (relative to Duke proposal)	0.5%	1.7%

Q. Are there other potential changes to avoided cost rates not captured in the above analysis that may also be warranted?

1 A. Yes. As explained in my direct testimony, and the remainder of this surrebuttal, there are
2 several outstanding issues. However, these require more detailed modeling efforts to be
3 undertaken by Duke, which was not possible in the timeframe of this proceeding.
4

5 VI. Avoided Energy Cost Modeling

6 **Q. How does Duke respond to SBA's concerns regarding the frequency of negative**
7 **hourly avoided cost values in its modeling results?**

8 A. Duke explains that negative values occur for a variety of reasons, and provides an
9 example of the impact a QF might have in shifting the start hour for a combustion turbine
10 from one hour to the next, thereby leading to a negative value for the new start hour.

11 **Q. Does this example make sense to you conceptually?**

12 A. Yes, although it is not possible to evaluate whether Duke's claims are true based on the
13 data they have provided. Nor has Duke denied that there are other modeling constraints
14 that artificially drive down avoided cost values (as suggested in my direct testimony).

15 **Q. Are you able to evaluate whether changes to the timing of startups, as suggested by**
16 **this example, is a major driver of negative values within Duke's model?**

17 A. No. Duke has not provided disaggregated data on hourly unit starts or startup costs that
18 would be needed to accurately evaluate whether this phenomenon is occurring. There
19 may also be other drivers of negative values, such as congestion and/or must-run
20 requirements.

21 **Q. What other factors does Duke say contribute to negative hours?**

1 A. Duke explains that the addition of a 100 MW QF resource would change the hours of
2 pumping and discharge for its pumped hydro facilities. Duke explains that this “frequently
3 drives negative hours, in DEC in particular.”¹⁵

4 **Q. Has Duke provided any data on the modeled dispatch of any individual facilities,**
5 **including its pumped hydro facilities?**

6 A. No. As a result, I have been unable to evaluate the impact that this could have on the
7 model results, including negative values.

8 **Q. What is Duke’s response to SBA’s observation that coal units are often the**
9 **marginal resource in DEC and DEP-East?**

10 A. Duke explains that while coal is often the marginal unit, “cycling restrictions and must run
11 restrictions often prevent them from reducing their output when additional generation is
12 added to the system.”¹⁶ As a result, the units that are able to reduce their output are often
13 gas units.

14 **Q. Are these cycling and must-run restrictions on coal units concerning to you?**

15 A. Yes. I am concerned about whether the inclusion of coal units with these restrictions –
16 particularly the must-run restrictions -- is appropriate and what effect that may have on
17 the model results.

18 **Q. Does the inclusion of these coal units reflect Duke’s actual resource plan over the**
19 **next 10 years?**

¹⁵ Snider Rebuttal, p 23

¹⁶ Snider Rebuttal at 26.

1 A. Apparently not. As discussed above, within a few weeks after releasing an IRP that
2 included these coal units, Duke announced the early retirement of over 1000 MW of coal
3 plants in its service territories within the next [10] years. It is not clear how Duke will
4 adjust its resource plan to accommodate these retirements, but what is clear is that the
5 model on which Duke bases its avoided energy calculations no longer reflects Duke's
6 plans for the operation of its system.

7 **Q. What effect might the inclusion of coal units with must-run restrictions have on the**
8 **model results?**

9 A. I believe it could have the effect of suppressing avoided cost values. As Duke explains,
10 these must-run coal units cannot be displaced even if they are the marginal unit (i.e.
11 higher cost than other units online). As a result, the addition of QF resources often
12 displaces power from lower-cost gas units instead of power from higher-cost coal units.
13 However, the fact that these coal units are online in the first place means that they push
14 down the remaining portion of the generation supply curve. This in turn will affect which
15 gas generation unit is backed down due to the addition of a QF (relative to a scenario
16 where the coal unit was not online). Put differently, if the must-run coal units were not
17 included, the marginal gas unit that is displaced would more likely be a higher-cost, less-
18 efficient gas unit. In that case, the avoided cost may be higher than what is currently
19 modeled.

20 **Q. How could Duke's model input decisions on this issue lead to lower avoided cost**
21 **values?**

22 A. There are two potential ways this could occur. First Duke could designate certain coal
23 units as must run regardless of their technical operating capabilities. Second, Duke could

1 include coal units in its IRP that are uneconomic and should be retired. Notably, the
 2 NCUC in its recent order on Duke's IRP required additional analysis on potential "cost
 3 savings attributable to earlier retirement of such plants."¹⁷ Additionally, as noted earlier,
 4 Duke has recently announced early retirement of over 1000 MW of coal facilities that
 5 were not reflected in 2019 IRP Update.

6 **Q. Has Duke provided detailed information about the cycling and must-run**
 7 **restrictions of its coal units?**

8 A. No.

9 **Q. What do recommend as a remedy to these concerns?**

10 A. As an initial matter, I recommend that Duke provide additional transparency and data on
 11 the following:

- 12 • Detailed descriptions of must-run and cycling restrictions and the rationale for including
- 13 these.
- 14 • Hourly data on when must-run units are operating.
- 15 • Hourly data on pumped hydro dispatch in the base case and change case
- 16 • Hourly data on the timing of individual unit starts

17 Additionally, I recommend that Duke's model be rerun without the must-run coal units
 18 included as a sensitivity analysis to determine their effect on avoided energy costs.

19 **Q. What was Duke's response to your concerns regarding the difference in marginal**
 20 **units for DEP-East and DEP-West?**

¹⁷ NCUC Order Accepting Integrated Resource Plans And Reps Compliance Plans, Scheduling Oral Argument, And Requiring Additional Analyses, Docket No. E-100, Sub 157

1 A. Duke explains that the “DEP-East and DEP-West BAAs operate as a single DEP NERC
2 Balancing Authority, and are interconnected through firm transmission interconnects that
3 allow integrated system dispatch of all fleet generating units in DEP-East and DEP-West
4 to serve load in both DEP-West”¹⁸

5 **Q. Does this mean that the marginal unit will be the same in DEP-East and DEP-West**
6 **at all times?**

7 A. Not necessarily. While this may be true the majority of the time, it is possible that there
8 are times when the firm transmission capability between the DEP-East and DEP-West
9 areas reaches its limit. In this case there would be a different marginal unit in each area.

10 **Q. Has Duke provided any data or information on the frequency or timing of when this**
11 **transmission limit has been reached in its model?**

12 A. Not to my knowledge.

13 **Q. What do you recommend to account for this possibility that the marginal unit could**
14 **be different between the two areas, at least during some hours?**

15 A. Consistent with my direct testimony, I recommend that avoided cost values be calculated
16 for both areas. If there are no times when the transmission limit is reached, then the
17 results should be equivalent. However, if there are in fact times when the limit is reached,
18 then the results would be more accurate. This would also be consistent with Act 62,
19 which allows for more location-specific pricing which “may account for differences in
20 costs avoided based on the geographic location and resource type.”¹⁹

¹⁸ Snider Rebuttal p 27

¹⁹ Act 62

VII. Rate Design

Q. What reactions does Duke provide to SBA's proposed alternative rate design for DEC?

A. Duke implies that SBA's proposal:

a) is too focused on the specific operating characteristics of solar QFs

b) ignores Duke's proposed design which intended to offer higher prices during times of higher value

c) is not administratively manageable

Q. Do you agree with this characterization?

A. No. Regarding the first point (i.e. focus on solar QFs), our proposed alternate time periods are agnostic as to the underlying technology of the QF resource. The proposed time periods are nearly identical to Duke's, except that they provide additional price accuracy by breaking two of Duke's proposed time periods into two parts, thus providing additional granularity. While our proposal may be better for solar QFs, it is intended to better reflect the value of energy delivered from any QF resource. Regarding the second point (i.e. ignores Duke's design principles), the SBA proposal actually reinforces Duke's design principles rather than ignoring them. It provides more granularity in pricing and less averaging of values. Regarding the third point (administrability), SBA's proposal only adds two time periods to the existing nine periods. This has not caused confusion for the industry that SBA represents and since prices are fixed for the PPA term there should be no "confusion" if future price changes were to occur that affect future QFs.

VIII. Large PPAs with Storage

Q. What does Duke say regarding the fact that a technology-specific approach for avoided costs is not appropriate for facilities that include storage?

A. Duke concedes that this “is a fair point”²⁰ and agrees that the avoided energy rates should reflect the characteristics of a storage device. However, the Company fails to provide any solutions that reflect this and continues to support the application of a solar-specific generation profile, even to solar QFs that include storage.

IX. Avoided Capacity Cost Assumptions

Q. Does Duke dispute your critique of the economies of scale adjustment to the capital cost of a new peaker?

A. Yes. The companies explain that “the infrastructure cost per CT would be lower for a four-unit site compared to a single CT site.”²¹

Q. According to their 2019 IRPs, do either DEC or DEP plan to construct a four-unit plant as their next peaker addition?

A. No. According to Snider’s Rebuttal testimony both companies are planning two CT additions as their next capacity additions rather than four. As Snider states: “DEC’s 2019 IRP shows a block of two F-class CTs projected in 2026” and “DEP’s 2019 IRP shows two F-class CTs in 2028.” Thus, in both cases, the concept of a 4-unit plant is not even reflected in the utilities own planning models.

²⁰ Snider Rebuttal, p 34

²¹ Snider Rebuttal at 46.

1 **Q. If the Commission accepts Duke's assumed capital costs for a new peaker, what**
2 **would be a fair way to ensure that QF resources are competing on a level playing**
3 **field with utility-owned generation?**

4 A. At the same time the Commission approves avoided capacity rates in this proceeding, the
5 Commission could also adopt a strict cap on rate recovery for any future utility-owned
6 generation capacity costs. This cap should be set at Duke's proposed level of capital costs
7 for a new peaker – specifically, \$[REDACTED]/kW in 2019 dollars (indexed for inflation). This
8 would ensure that both utility-owned generation and competitive third-party generation
9 (in the form of QFs) are provided an equivalent level of compensation for providing
10 capacity to Duke's customers.

11 **Q. Do you agree with Duke's explanation that transmission interconnection costs are**
12 **already fully included in the peaker capital costs?**

13 A. Not in all cases. Duke points to the EIA documentation on this matter, which does appear
14 to include some interconnection costs for the plant switchyard and "interconnection to an
15 'adjacent' (e.g. within a mile) of the plant."²² However it specifically "does not include
16 significant transmission system upgrades."²³ Thus, if the plant is more than a mile from
17 the point of interconnection, these costs could be significantly higher. Additionally, it is
18 possible that there would significant transmission upgrades for any plant that do not fall
19 within the category of network system upgrades.

²² EIA Capital Cost Estimates for Utility Scale Electricity Generating Plants, Appendix B, at 2-7, *available*
at https://www.eia.gov/analysis/studies/powerplants/capitalcost/pdf/capcost_assumption.pdf

²³ See above.

1 **Q. Do you agree with Duke’s assertion that “utilities are not obligated to pay QFs for**
2 **capacity that exceeds system needs, such as for resale in a capacity market under**
3 **PURPA”?**

4 A. I don’t disagree with this. However, it is still worth noting that, regardless of what is
5 required under PURPA, there is value from the capacity that QFs do provide, whether
6 that is in the form of avoided purchases or increased sales opportunities. Notably, Duke
7 did not dispute that there may be avoided capacity costs related to near-term purchases,
8 with the exception of “existing capacity arrangements.”²⁴

9 **Q. Did your direct testimony assume that QFs will renew their contracts as Duke**
10 **claims?**

11 A. No. Duke misinterpreted my testimony in this regard. I did not actually quantify or
12 propose that potential contract renewals be taken into account for the purpose of
13 establishing rates under PURPA. I was simply making the observation that this is possible
14 and may be a qualitative factor the Commission could consider when assessing whether
15 Duke’s proposed avoided cost rates are appropriate.

16
17 **X. Seasonal Allocation of Capacity Value**

18 **Q. In your direct testimony, you made a preliminary recommendation of the seasonal**
19 **allocation for capacity value based simply upon historical load, correct?**

²⁴ Snider Rebuttal at page 54.

1 A. Yes. This was done as a simple first approximation based upon available data and
2 accelerated time constraints of this proceeding that prevented me from conducting a more
3 thorough analysis.

4 **Q. Do you believe this preliminary method could be improved upon?**

5 A. Yes. As I stated in my direct testimony, “I may propose a more specific allocation
6 later.”²⁵

7 **Q. What specific critiques did Duke raise with your preliminary method?**

8 A. Duke’s primary concerns were that this approach 1) “did not take into account the impact
9 of must-take solar output” and 2) “incorrectly included an extremely broad number of
10 hours by using the ‘top 5% of load hours.’”²⁶

11 **Q. Do you agree with these critiques?**

12 A. I do, with some qualifications that I will explain below.

13 **Q. What specific changes would you recommend to address these issues?**

14 A. To address the first issue, I would update my analysis to reflect net load (rather than just
15 load) by adjusting the historical load profiles to account for must-take solar output. To
16 address the second issue, I would adjust the number of hours to reflect a narrower band
17 of top load hours.

18 **Q. Have you now performed this analysis?**

19 A. Yes. The results are provided in the table below.

20 **Q. What level of must-take solar did you use to calculate net load?**

²⁵ Burgess, Direct, p 53.

²⁶ Snider Rebuttal, p 69.

A. Consistent with ORS' recommendation, I believe it is appropriate to consider the "Existing plus Transition" level of solar for the current proceeding since it best reflects the amount of solar that is either currently online or will be in the near future. Thus, I have subtracted from the hourly load values and amount of generation consistent with 840 MW of solar for DEC and 2950 MW of solar for DEP.²⁷ These values could be updated in future avoided cost calculations as additional solar comes online but they are appropriate for the current proceeding.

Q. What number of hours is appropriate to consider when evaluating loss of load risk?

A. While there are metrics commonly used in the industry (e.g. 1 day in 10 years), these have always been somewhat subjective and are the result of engineering judgement calls that attempt to balance a tolerable level of risk with the significant cost of reducing that risk. Thus, while there is no objectively "correct" value, I am willing to accept Duke's suggestion that my initial assessment may have included an overly broad number of hours.

Q. What adjustment did you make to the number of hours considered to be high loss of load risk for seasonal allocation purposes?

A. I reduced the number of hours by a factor of 50 – that is from the top 5% of load hours to the top 0.1% of load hours.

	DEC		DEP	
	Summer	Winter	Summer	Winter

²⁷ Hourly solar output profiles were estimated for a South Carolina location using the National Renewable Energy Laboratory's PV Watts simulator tool.

Historical Load Only (top 5%)	82%	18%	77%	23%
Adjusted for Net Load (Existing + Transition, top 5%)	79%	21%	63%	37%
Adjusted for Net Load and 0.1% of Top Load Hours	58%	42%	4%	96%

Q. What other factors are important in determining loss of load risk, and the corresponding seasonal allocations for capacity value?

A. As explained in my direct testimony, other important factors include future load shapes, future demand response resources, and the availability of neighbor assistance – especially from summer peaking utilities.

Q. Did Duke adequately respond to your requests for more information on these issues?

A. No. Despite multiple requests from SBA, Duke refused to provide any revised analysis with changes to these input assumptions.²⁸ For example, regarding a request to model increased winter demand response, Duke states in its Rebuttal, “The Companies did not run this scenario since it is irrelevant given that large quantities of demand response participation are not achievable within such a short timeframe nor are they appropriate to assume in this case.”²⁹

Q. Do you agree that this scenario is irrelevant?

²⁸ See Duke’s response to SBA RFP 3-4 ([attached as Burgess Ex. 3](#)).

²⁹ Snider Rebuttal, p 66.

1 A. Not at all. The purpose of requesting this scenario was not based on whether a larger
 2 quantity of demand response should be considered feasible. Rather, this was simply
 3 intended as a sensitivity case to see what the effect would be on the Company's assumed
 4 seasonal allocations. Even a more modest increase in winter demand response might have
 5 significant effects and may be worth further consideration in this proceeding and others.
 6 However, Duke appears unwilling to provide this information.

8 XI. Integration Services Charge

9 **Q. Do you agree with Duke's claim (on page 85 of Mr. Snider's Rebuttal Testimony)**
 10 **that the proposed cap on the Integration Services Charge represents a "balanced"**
 11 **solution for both QF and customer interests?**

12 A. No. Duke presents a false notion of balance on this issue. As addressed in my Direct
 13 testimony, the integration charge represents a potential savings to customers on the order
 14 of <1% in an effort to cover costs that may not even materialize to any significant degree.
 15 By contrast, the proposed cap is so high as to render future projects unfinanceable and
 16 would place a significant barrier on new QF development.

17 **Q. What restrictions does Duke's coal fleet have that could affect its ability to respond**
 18 **to solar volatility?**

19 A. As explained by Duke, many of its coal units have cycling and must-run restrictions that
 20 prevent them from ramping up or down.³⁰ This likely means that other units may need to
 21 be committed to provide operating reserves to respond to solar volatility. If these

³⁰ See Snider Rebuttal at p 26.

1 inflexible coal units were not online, then the additional gas units committed in their place
2 may have the flexibility needed to provide integration services at a lower overall cost. As
3 such, it is logical to assign some portion of any modeled integration costs to inflexible
4 coal units, rather than attributing them solely to solar, since these costs may be higher
5 when the coal units are operating.

6 **Q. Do you agree with Duke's suggestion that compensation for additional ancillary**
7 **services, beyond mitigation of those caused by solar, should not be considered?**

8 A. No. Duke argues that such a compensation structure was "not envisioned by PURPA"³¹
9 however this does not mean it is impermissible or should not be encouraged. Whatever
10 Duke's interpretation of PURPA, Act 62 specifically requires the utility to calculate the
11 value of "ancillary services provided by or consumed by small power producers." S.C.
12 Code Ann. § 58-41-20(B)(3). There is no basis for treating ancillary services provided by
13 QFs differently from those allegedly consumed by them. Furthermore, Duke argues that
14 providing these services "would [not] be economic under a must take PURPA
15 contract."³² However, there is no way to know if this is true unless the option is offered
16 at a fair compensation rate to potential QF resource providers.

17 **Q. Based on your analysis of Duke's avoided cost methodologies, including the**
18 **assumptions and inputs, what avoided cost rates does SCSBA propose that the**
19 **Commission adopt in this proceeding?**

³¹ Snider Rebuttal, p 88.

³² See above.

1 A. First it must be noted that, as described above, Duke's avoided cost methodologies were
2 not reasonably transparent and, lacking access to Duke's proprietary production cost
3 modeling, it was not possible for SCSBA to calculate avoided cost rates using precisely
4 the same methodologies employed by Duke. As discussed in my testimony, there are
5 many methodological flaws in Duke's avoided cost calculations. In some cases it is
6 possible to quantify the impact of those flaws on Duke's rates; in other cases it would
7 only be possible to precisely quantify those effects by re-running Duke's production cost
8 simulation and other modeling, and using those results to calculate rates.

9 In my view, the most reasonable approach for the Commission to take, if it agrees that
10 Duke's methodologies are flawed, would be to direct Duke to address these flaws and
11 recalculate its rates. In my experience this is the approach usually taken by other state
12 utilities commissions in situations like this.

13 However, if the Commission does not wish to take this approach, SCSBA has provided a
14 set of proposed avoided cost rates, based on (1) where possible, a quantification of the
15 impacts of Duke's methodological flaws, and (2) where quantification is not possible, a
16 reasonable estimate of the impact based on my experience and expertise. SCSBA's
17 proposed rates are attached in Exhibit **Burgess 2**.

Burgess Ex 3
Duke's Response to SBA RFP 3-4

BEFORE
THE PUBLIC SERVICE COMMISSION OF
SOUTH CAROLINA

DOCKET NO. 2019-185-E
DOCKET NO. 2019-186-E

IN RE:

South Carolina Energy Freedom Act (H.3659))	DUKE ENERGY CAROLINAS,
Proceeding to Establish Duke Energy Carolinas,)	LLC AND DUKE ENERGY
LLC's and Duke Energy Progress LLC's)	PROGRESS, LLC'S RESPONSE
Standard Offer Avoided Cost Methodologies,)	TO SOUTH CAROLINA SOLAR
Form Contract Power Purchase Agreements,)	BUSINESS ALLIANCE, INC.'S
Commitment to Sell Forms, and Any Other)	THIRD INTERROGATORIES
Terms or Conditions Necessary (Includes Small)	AND REQUESTS FOR
Power Producers as Defined in 16 United States)	PRODUCTION
Code 796, as Amended) – S.C. Code Ann.)	
Section 58-41-20(A))	
_____)	(Non-Confidential Version)

Duke Energy Carolinas, LLC (“DEC”) and Duke Energy Progress, LLC (“DEP,” together with DEC, “Duke Energy” or the “Companies”), by and through counsel, pursuant to Rules 103-833(B), 103-833(C) and 103-835 of the Rules of Practice and Procedure of the South Carolina Public Service Commission and the South Carolina Rules of Civil Procedure, hereby respond to Intervenor, South Carolina Solar Business Alliance, Inc.’s (“SCSBA”) Third Interrogatories and Requests for Production as follows:

RESPONSES TO THIRD INTERROGATORIES

1. Please describe in detail all measures you have taken, plan to take, or are considering taking during the last five (5) years or over the next ten (10) years in order to reduce or mitigate winter peak events on Your System, including but not limited to demand response or other demand-side management measures and purchases from other utilities or PJM. Please quantify your projections of the amount of additional capacity, demand reduction, or other mitigation you have achieved or

each solar tranche so the data requested would be significant. However, the neighbor modeling from the 2016 Resource Adequacy Study showed that external market assistance assumed in the simulations reduced reserve margin requirements by approximately 6% each for DEP and DEC. This equates to market assistance of approximately 1,200 MW for DEC and approximately 900 MW for DEP. Because neighbor loads varied and generator performance was stochastically modeled, there are hours where available market assistance was higher or lower than these estimates.

4. Please refer to Duke's response to SBA First Interrogatory 1-d, including confidential file "DEC_DEP Hourly LOLE_SBA DR 1-D_CONFIDENTIAL.xlsx." Please provide an updated version of this analysis that includes the following modified inputs (and no other changes):

- a.** 1,031 MW of demand response in winter for DEC and 1,015 MW of demand response in winter for DEP.
- b.** Available assistance from each neighbor (in MW) increased by 20% in all hours.

RESPONSE: **a.** As noted in response to SBA Int 2-8, the requested scenario was not conducted as part of the Solar Capacity Value study. Therefore, the Companies have no information to provide in response to this question.

b. The requested scenario was not conducted as part of the Solar Capacity Value study. Therefore, the Companies have no information to provide in response to this question.

5. Produce all documents related to any resource adequacy study relied on by You in support of any Avoided Cost Calculation of Methodology, including but not limited to Astrape Consulting's 2016 DEC and DEP Resource Adequacy (RA) Studies.

21. Please provide a detailed quantification of the “historical realized operating reserves” (as that term is used in Mr. Wintermantel’s testimony maintained by DEC and DEP, on a monthly basis, over the last ten (10) years.

RESPONSE: Please see the Companies' response to SBA Interrogatory 3-14.

**** DEC and DEP reserve the right to supplement their responses to these requests should additional responsive documents be identified. ****

Dated this 17th day of September, 2019.
